Feldspar (68476-25-5)	
STOT-single exposure	May cause respiratory irritation.
STOT-repeated exposure	Causes damage to organs (lungs) through prolonged or repeated exposure.  Respirable crystalline silica in the form of quartz or cristobalite from occupational sources is listed by the International Agency for Research on Cancer (IARC) and National Toxicology Program (NTP) as a lung carcinogen. Prolonged exposure to respirable crystalline silica has been known to cause silicosis, a lung disease, which may be disabling. While there may be a factor of individual susceptibility to a given exposure to respirable silica dust, the risk of contracting silicosis and the severity of the disease is clearly related to the amount of dust exposure and the length of time (usually years) of exposure.

Symptoms/effects after inhalation	May cause irritation to the respiratory tract. vapors are heavier than air and can cause suffocation by reducing oxygen available for breathing. Symptoms of oxygen deficiency include respiratory difficulty, headache, dizziness, nausea, unconsciousness or death.
Symptoms/effects after skin contact	May cause skin irritation. Repeated exposure may cause skin dryness or cracking.
